

# PROPOSITIONAL RESOLUTION<sup>1</sup>

## LECTURE 3

---

<sup>1</sup>The slides have been prepared using the textbook material available on the web, and the slides of the previous editions of the course by Prof. Luigia Carlucci Aiello

## Summary

- resolution [RN, 7.5 + some additional material]

# Resolution

- One inference rule
- Requires **normal** form

## Clauses

- ◇ *Literals*: propositional symbols (*atoms*) or negated atoms.
- ◇ A *formula* is in *negation normal form (NNF)* if negations appear only in front of atoms.
- ◇ A *clause* is a disjunction of literals  $L_1 \vee L_2 \vee \dots \vee L_n$ .
- ◇ A formula is in *conjunctive normal form (CNF)* or in *clausal form* or it is called a *set of clauses* if:  
it is in negation normal form and  
it is  $C_1 \wedge C_2 \wedge \dots \wedge C_n$  where  $C_i$  are clauses.

## Clauses (cont.)

◇ Since disjunction is commutative:

$$A_1 \vee A_2 \vee \dots \vee A_n \vee \neg B_1 \vee \neg B_2 \vee \dots \vee \neg B_m$$

where  $A_i$  and  $B_j$  are atoms.

◇ When  $n = m = 0$  we have the *empty clause*, denoted  $\{\}$ , or  $\square$ .

◇ Clause:  $\{L_1, L_2, \dots, L_p\}$ .

◇ Let  $L$  be a literal and  $C = \{L_1, L_2, \dots, L_p\}$  be a clause  
 $L \cup C$  denotes  $C' = \{L\} \cup C$ , i.e.  $C' = \{L, L_1, L_2, \dots, L_p\}$ .

## Horn Clauses

◇ A clause is **Horn** if  $n \leq 1$ :

example:  $P \vee \neg Q \vee \neg R$

corresponding to  $Q \wedge R \Rightarrow P$

◇ A CNF is Horn if all its clauses are Horn

◇ If  $n = 1$ :

$$A_1 \vee \neg B_1 \vee \dots, \vee \neg B_m$$

we have a definite (Horn) clause.

## $\alpha$ and $\beta$ formulae

Conjunctive formulae  $\alpha$  and disjunctive formulae  $\beta$  :

$\alpha$	$\alpha_1 \quad \alpha_2$	$\beta$	$\beta_1 \quad \beta_2$
$A \wedge B$	$A \quad B$	$A \vee B$	$A \quad B$
$\neg(A \vee B)$	$\neg A \quad \neg B$	$\neg(A \wedge B)$	$\neg A \quad \neg B$
$\neg(A \Rightarrow B)$	$A \quad \neg B$	$A \Rightarrow B$	$\neg A \quad B$

## Trasformation in clausal form: algorithm

let  $F$  be a propositional formula:

*Step 1* let  $\{F\}$  be the initial set.

*Step  $n+1$*  Let the result of step  $n$  be  $\{D_1, \dots, D_n\}$ , where  $D_i$  is a disjunction  $\{A_1^i, \dots, A_k^i\}$ ; if  $A_j^i$  is not a literal, we do not have yet a CNF and ...

## Transformation in clausal form: algorithm (cont.)

Choose a  $D_i$  which contains a non literal  $X$ :

- a. if  $X$  is  $\neg\top$  replace it with  $\perp$ ;
- b. if  $X$  is  $\neg\perp$  replace it with  $\top$ ;
- c. if  $X$  is  $\neg\neg A$  replace it with  $A$ ;
- d. if  $X$  is a  $\beta$  formula replace it with  $\beta_1, \beta_2$ ;
- e. if  $X$  is a  $\alpha$  formula replace  $D_i$  with two clauses  $D_i^1$  and  $D_i^2$ , where  $D_i^1$  is  $D_i$  with  $\alpha$  replaced by  $\alpha_1$  and  $D_i^2$  is  $D_i$  with  $\alpha$  replaced by  $\alpha_2$ .

## Expansion rules

◇ Steps a – e and can be written as expansion rules:

---

$$\begin{array}{ccccc} 1. & \frac{\neg\neg A}{A} & 2. & \frac{\neg\top}{\perp} & 3. & \frac{\neg\perp}{\top} & 4. & \frac{\beta}{\beta_1, \beta_2} & 5. & \frac{\alpha}{\alpha_1 \mid \alpha_2} \end{array}$$

---

## Properties

Lemma:

Let  $D$  be a disjunction  $\{A_1, \dots, A_k\}$ . If  $D'$  is obtained from  $D$  by applying rules a – e of the algorithm:

$$D \equiv D'$$

.

## Example

1.  $F = (P \Rightarrow (Q \Rightarrow (S \vee T))) \Rightarrow (T \Rightarrow Q)$
2.  $C = \{\neg(P \Rightarrow (Q \Rightarrow (S \vee T))), (T \Rightarrow Q)\}$   
( $\beta$ -rule to  $F$ )
3.  $C_1 = \{P, (T \Rightarrow Q)\}$ ,  $C_2 = \{\neg(Q \Rightarrow (S \vee T)), (T \Rightarrow Q)\}$   
( $\alpha$ -rule to  $C$ )
4.  $C_1 = \{P, \neg T, Q\}$ ,  $C_2 = \{\neg(Q \Rightarrow (S \vee T)), (T \Rightarrow Q)\}$   
( $\beta$ -rule to  $C_1$ )

## Example (cont.)

5  $C_1 = \{P, \neg T, Q\}$ ,  $C_2 = \{\neg(Q \Rightarrow (S \vee T)), \neg T, Q\}$   
( $\beta$ -rule to  $C_2$ )

6  $C_1 = \{P, \neg T, Q\}$ ,  $C_2 = \{Q, \neg T, Q\}$ ,  $C_3 = \{\neg(S \vee T), \neg T, Q\}$   
( $\alpha$ -rule to  $C_2$ )

7  $C_1 = \{P, \neg T, Q\}$ ,  $C_2 = \{Q, \neg T, Q\}$ ,  $C_3 = \{\neg S, \neg T, Q\}$ ,  
 $C_4 = \{\neg T, \neg T, Q\}$   
( $\alpha$ -rule to  $C_3$ )

## Propositional resolution

◇ Let  $\{L\} \cup D_1$  and  $\{\neg L\} \cup D_2$  be two clauses.  $D_1 \cup D_2$  is obtained from  $\{L\} \cup D_1$  and  $\{\neg L\} \cup D_2$  by a *resolution step* written:

$$\frac{\{L\} \cup D_1 \quad \{\neg L\} \cup D_2}{D_1 \cup D_2}$$

◇ A *resolution tree* is a binary tree whose nodes are labelled by clauses. Let  $C_1$  and  $C_2$  be 2 brother nodes, whose father is  $C$ , then  $C_1 = D_1 \cup \{L\}$ ,  $C_2 = D_2 \cup \{\neg L\}$  and  $C = D_1 \cup D_2$ . The label associated with the father is the result of a resolution step applied to the sons.

## Propositional resolution (cont.)

◇ Let  $\Gamma$  be a finite set of clauses, and  $C$  a clause.  $C$  can be derived by *resolution* from  $\Gamma$  iff there exists a resolution tree whose root is labelled by  $C$  and all the leaves are clauses in  $\Gamma$ .

$\Gamma \vdash_R C$  denotes that  $\Gamma$  derives  $C$  by resolution.

## Example

Let  $\Gamma = \{\{P\}, \{Q\}, \{\neg P, \neg Q\}\}$ :

resolution tree for  $\Gamma \vdash_R \{\}$ .

$$\frac{P \quad \frac{Q \quad \neg P \vee \neg Q}{\neg P}}{\{\}}$$

## Resolution and satisfiability

1. let  $\Gamma$  be a set of clauses,  $\{L\} \cup D_1 \in \Gamma$  and  $\{\neg L\} \cup D_2 \in \Gamma$ .  
If  $\Gamma$  is satisfiable then  $\Gamma \cup \{D_1 \cup D_2\}$  is satisfiable;
2. let  $\Gamma$  be a set of clauses, if  $\Gamma \vdash_R \{\}$  then  $\Gamma$  is unsatisfiable.

We prove 1. Suppose  $\Gamma$  be satisfiable, i.e. there exists a model  $\mathcal{M}$ ; such that  $\mathcal{M} \models \Gamma$  and suppose that  $L$  is true in  $\mathcal{M}$ ; it follows that  $\neg L$  is false in  $\mathcal{M}$  and therefore  $D_2$  must be true in  $\mathcal{M}$ . Consequently,  $D_1 \cup D_2$  is true in  $\mathcal{M}$ . Since  $\mathcal{M}$  is a model of  $\Gamma$  by hypothesis,  $\Gamma \cup \{D_1 \cup D_2\}$  is true in  $\mathcal{M}$ .

$\mathcal{M} \models \neg L$  is analogous.

## Resolution and satisfiability (cont.)

$\{\}$  denotes contradiction; the empty clause is unsatisfiable.

Since resolution preserves satisfiability, if the empty clause is generated then the initial set of clauses is unsatisfiable.

Resolution proofs work by **refutation**:  $\Gamma \vdash_R F$  is proven by checking whether  $\Gamma \cup \{\neg F\} \vdash_R \{\}$ , where  $\Gamma$  is a set of clauses and  $\{\neg F\}$  is the negation of  $F$  in clausal form.

## Example

We prove that  $A \Rightarrow C$  follows from  $A \Rightarrow B$  and  $B \Rightarrow C$ :

1.  $(A \Rightarrow B) \wedge (B \Rightarrow C) \wedge \neg(A \Rightarrow C)$
2.  $\{\neg A \vee B\}, \{\neg B \vee C\}, \{A\}, \{\neg C\}$  *(transf. in clausal form)*
3.  $\{\neg A \vee C\}, \{A\}, \{\neg C\}$  *(res.  $B$  and  $\neg B$  in 1<sup>st</sup> and 2<sup>nd</sup> claus. of 2)*
4.  $\{C\}, \{\neg C\}$  *(res.  $\neg A$  and  $A$  in 1<sup>st</sup> and 2<sup>nd</sup> claus. of 3)*
5.  $\{\}$  *(res.  $C$  and  $\neg C$  in 1<sup>st</sup> and 2<sup>nd</sup> claus. of 4).*

## Resolution is satisfiability-complete

Let  $\Gamma$  be a set of clauses.  $\Gamma$  is unsatisfiable iff  $\Gamma \vdash_R \{\}$ .

Let  $RC(\Gamma)$  denote the **resolution closure** (i.e. the finite set of clauses that can be derived from  $\Gamma$  using the resolution rule):

$\Gamma$  is unsatisfiable iff  $\{\} \in RC(\Gamma)$

## Resolution is satisfiability-complete: proof

Proof by contradiction: If  $\{\} \notin RC(\Gamma)$  then  $\Gamma$  is satisfiable.  
Build a model from  $RC(\Gamma)$ :

- If a clause in  $RC(\Gamma)$  contains the literal  $\neg P_i$  and all its other literals are *false* (given previous assignments), then assign *false* to  $P_i$ .
- Otherwise assign *true* to  $P_i$

This assignment can falsify a clause only when in  $RC(\Gamma)$  there are two clauses:  $false, false, \dots, P_i$  and  $false, false, \dots, \neg P_i$ ; but this is impossible because  $RC(\Gamma)$  is closed under resolution.

**Resolution is sound and complete for propositional logic**

## ... but not validity-complete

Let  $\Gamma = \{\{P\}\}$  and let  $C = \{P, Q\}$ ;

$\Gamma$  logically entails  $C$ , and it can be derived by refutation,

but  $\Gamma \vdash_R C$  can not be directly derived by applying a resolution step.

## Resolution algorithm

Proof by contradiction, i.e., show  $KB \wedge \neg\alpha$  unsatisfiable

**function** PL-RESOLUTION( $KB, \alpha$ ) **returns** *true* or *false*

$clauses \leftarrow$  set of clauses in the CNF repres. of  $KB \wedge \neg\alpha$

$new \leftarrow \{ \}$

**loop do**

**for each**  $C_i, C_j$  **in**  $clauses$  **do**

$resolvents \leftarrow$  PL-RESOLVE( $C_i, C_j$ )

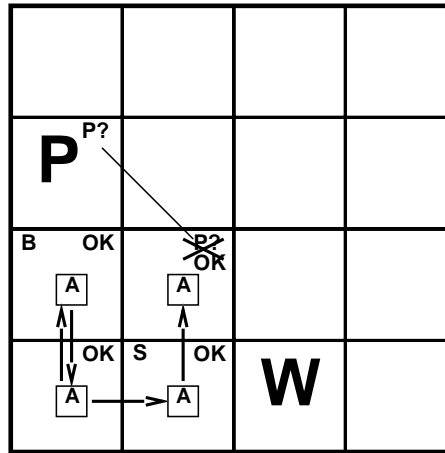

**if**  $\{ \} \in resolvents$  **then return** *true*

$new \leftarrow new \cup resolvents$

**if**  $new \subseteq clauses$  **then return** *false*

$clauses \leftarrow clauses \cup new$

# Resolution for the wumpus world

$$KB = (B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})) \wedge \neg B_{1,1}$$

$$\alpha = \neg P_{1,2}$$

$$KB \wedge \neg \alpha \Leftrightarrow$$

$$\{\{\neg B_{1,1}, P_{2,1}, P_{1,2}\}, \{B_{1,1}, \neg P_{2,1}\}, \{B_{1,1}, \neg P_{1,2}\}, \{\neg B_{1,1}\}, \{P_{1,2}\}\}$$

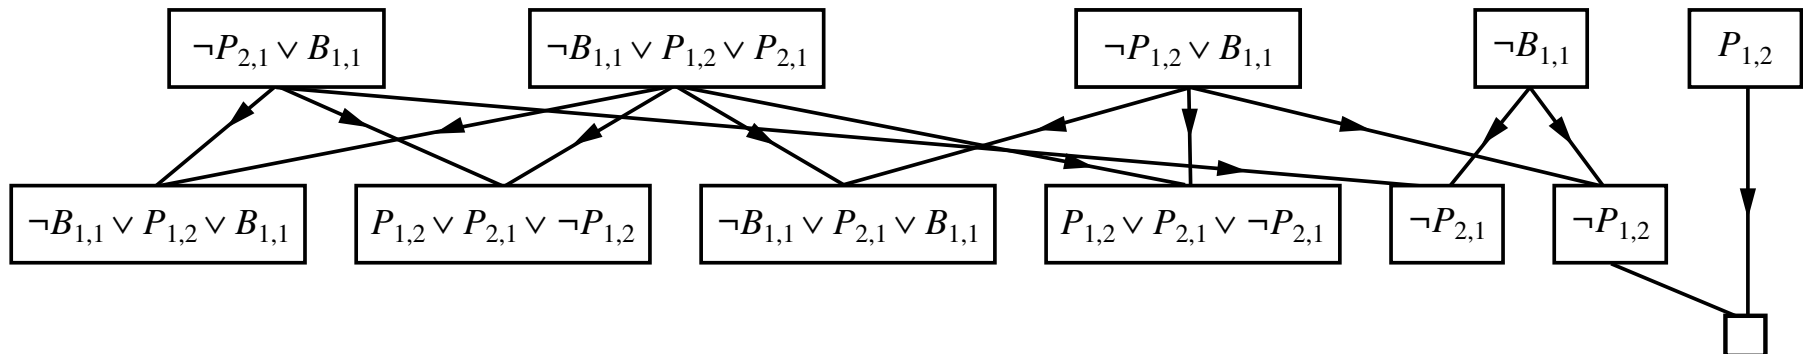

## Resolution example

$$KB = (B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})) \wedge \neg B_{1,1}$$

$$\alpha = \neg P_{1,2}$$

$$\frac{P_{1,2} \quad \frac{\neg B_{1,1} \quad \neg P_{1,2} \vee B_{1,1}}{\neg P_{1,2}}}{\{}}$$

## Summary

Resolution is a proof procedure that is sound and complete for satisfiability.

Resolution is the basis for reasoning systems, in particular for FOL.
